

A close-up photograph of several young microgreen plants growing out of dark, rich soil. The plants have small, vibrant green leaves and thin, light-colored stems. Some leaves have small water droplets on them. The background is dark and out of focus, emphasizing the plants in the foreground.

SproutBox

A demand-driven microgreens
production and supply platform.

Investor Brief: Distributed Agriculture at Scale.

The Distance Between Farm and Table is Too Far

The Broken Chain

Restaurants face inconsistent quality, long supply chains, heavy inventory risk, and zero transparency into their sourcing.

The SproutBox Thesis

The most efficient way to source hyper-fresh produce is to decentralize the farm and move it into the neighborhood.

Decentralized Growth, Centralized Orchestration.

SproutBox connects restaurants directly to a distributed network of local home growers. Demand dictates production, ensuring zero waste and same-day harvests.

Demand-Side Value: The Kitchen

Real-Life Case: Chef Maria, Fine Dining

Maria needs exactly 2kg of vibrant radish shoots every Tuesday and Friday to maintain her menu's standard.

Precision Ordering:

She enters '2kg' and the system auto-converts her request into exact tray counts (~8 trays).

Set-and-Forget Subscriptions:

Automates her recurring bi-weekly deliveries.

SproutBox Restaurant Dashboard

New Order

Ingredient: 2kg Radish Shoots

Quantity: 2kg

Quality Feedback

Rating: ★★★★★

Feedback: ★★★★★

Absolute Transparency:

Real-time tracking from 'Assigned' to 'Delivered'.

Closed-Loop Quality:

Direct feedback and rating on every harvest she receives.

Supply-Side Value: The Local Grower

Real-Life Case: John, Urban Cultivator

John has unused apartment space and wants extra income, but doesn't know what to grow or how to guarantee a sale.

Guaranteed Sales:
John only grows what is already sold via direct tray assignments.

Foolproof Guidance:
He receives day-by-day, crop-specific growing instructions.

Milestone Tracking:
Uploads daily growth photos for systemic quality control.

Yield Recording:
Logs harvest weight and quality ratings to trigger guaranteed payouts.

The Tray: Our Standardized Unit of Scale

By converting raw weight into standardized production tasks, SproutBox creates a frictionless, predictable micro-economy.

Input: Restaurant request volume
(e.g., 1 kg)

Algorithm: Auto-converts volume to
production units (1 Tray $\approx$ 0.25 kg)

Output: 4 Tray Assignments distributed
instantly to available local growers

The Future of Fresh is Local, Distributed, and Data-Driven.

Zero Inventory Risk:

Production is strictly demand-driven.

Infinite Scalability:

A truly distributed, asset-light supply network.

Standardized Unit Economics:

Driven by tray-level algorithmic orchestration.
